

Installation Instructions for Steerable Lift Axle Fender Bracket Kit 10001443

Document #10005682, Revision A

Brackets are Compatible with Models:

Eaton 4 Bolt Cam Flange, 20K Axle.

(Designed for use with MIN221800 & MIN2221 Fenders.)

STEP 1 - IDENTIFY PARTS

- Lay out parts and hardware packs.
- Compare the parts and hardware with bracket kit 10001443 as shown in **Figure 1**.

NOTE: Bolts are only provided for steps 3 & 4. Bolt sizes vary in step 2 depending on the application and are not provided.

STEP 2 - ATTACH BRACKETS TO TRUCK

- Remove the wheel assembly from the hub on the right side of the vehicle.
- Remove the hub and drum assembly.
 - With outboard hubs, you may only have to remove the drum.
- Remove the lower three backing plate to spindle bolts on the rear side of the spindle.
- Install the (10001536) rear fender bracket using longer grade 8 bolts and 2 to 4 SAE flat washers between the bracket and the spindle. (This is to get the bracket away from the irregular surface.)
- Install the (10001526) front fender bracket using the top two holes and lower front hole of the S-cam tube mounting flange.
 - Use 1/2" longer bolts than the existing bolt size.
- Re-install the hub, brake drum and wheel assembly.

NOTE:

- Repeat step 2 on the left side using fender brackets (10001535) and (10001525).

STEP 3 - POSITION BRACKETS AND FENDERS

- A. Place the Minimizer fender over the tire using shims for clearance. **(See Figure 2)**
 - a. Place a 1-1/2" block on top of the tire to establish a clearance between the tire and fender. **(See Figure 3)**
- B. Clamp the (10001493) aluminum arms parallel to the top edge of the steel fender brackets with vice grip clamps so the inside of the aluminum arm is 1-1/2" clear of the tire. **(See Figure 4)**
 - a. The aluminum arms may need to be adjusted inward or outward, so they make even contact with the fender.
 - i. For 315/80/R22.5 tires, the aluminum arm should be located on the outside face of the fender bracket.
 - b. If necessary, trim any excess material from aluminum arms that may extend past the bend in the mounting plate. **(See Figure 5)**

FIGURE 2

FIGURE 3

FIGURE 4

FIGURE 5

Mark and trim any excess material from the aluminum arms that extend past the bend in the mounting plate.

- C. Use the holes in the steel bracket attached to the axle as a template to locate and mark the mounting holes in the aluminum arms. **(See Figure 6)**
- D. Drill two 9/16" holes in each aluminum arm in the locations that were marked in the previous step.
- E. Bolt the aluminum arms to the steel fender brackets using the 1/2" x 2" flange head bolts and the 1/2" top lock flange nuts. **(See Figure 7)**
 - a. **Recommended torque is 75-83 ft.-lbs.**

FIGURE 6

FIGURE 7

STEP 4 - ATTACH FENDER TO BRACKETS

- A. Attach the (10001493) aluminum arms and (10001463) steel backing plates to the fender. (See Figure 8)

NOTE:

- The (10001463) steel backing plate and the (10001493) aluminum arm **MUST** be installed on opposing faces of the fender to be eligible for Minimizer warranty.

- B. Confirm that the fender is parallel to the tire.
- C. Align the (10001463) steel backing plate so it is even (top to bottom) with the (10001493) aluminum arm. Use one plate per aluminum arm.
- D. Drill two clearance holes or tap threads in the aluminum arms.
- Option 1 is to drill two 11/32" diameter holes thru the fender and aluminum arm using the steel backing plate as a template.
 - Use two 5/16"-18 bolts with self-locking nuts provided in the kit.
 - Option 2 is to drill and tap 5/16"-18 threads into the aluminum arm using the steel backing plate as a template. This option provides increased tire clearance.
 - Shorter 5/16" bolts are required for option 2 and are not included in the kit.
- E. Install fender bolts. **Recommended torque is 5-7 ft.-lbs.**
- DO NOT EXCEED THE RECOMMENDED TORQUE.**

STEP 5 - INSPECT AND REPEAT FOR ALL FENDERS

- A. Repeat steps 3 and 4 to install the fender on the opposite side of the vehicle.
